C.Accession: A38625
R.Accession: A38625
A.Title: A family of ras-like GTP-binding proteins expressed in electromotor neurons.
A.Reference number: A38625; MUD:91115900; PMID:1899244
A.Accession: A38625
A.Status: preliminary
A.Molecule type: manAA
A.Residues: 1-200 cMGS
A.Status: 1-200 cMGS
A.Cross-references: GB:M38390; NID:9213114; PIDN:AAA49230.1; PID:9213115
C.Superfamily: ras transforming protein; translation elongation factor Tu homology
C.Sepwords: GTP binding; membrane trafficking; nucleotide binding; P-loop
F:10-125/Domain: translation elongation factor Tu homology cFIU-125/Domain: GTP-binding motif A (P-loop)
F:152-125/Region: GTP-binding NKXD motif
F:152-154/Region: GTP-binding SAK/L motif

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                1 MAKQYDVLFRLLLIGDSGVG......LEEEEGKPEGPANSSKTCWC 212

The invention relates to novel isolated polypeptides (I), and discontinuous proteins (II). (II) and the antibody to (I) are useful for disponsing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune transplant relactions and graft versus host diseases, infectious diseases (e.g. hepatitis (), bleeding disorders, infelammatory conditions, organ transplant relacted disorders (sickle cell anaemia), myeloproliferative other blood-related disorders (sickle cell anaemia), myeloproliferative disorders (e.g. Alzheimer's disease, Parkinson's disease), chromosomal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal abnormalities (e.g. arrhythmia), respiratory disorders, dermatological disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders (e.g. arrhythmia), respiratory disorders, in wound healing, epithelial cell proliferation, endocrine disorders (e.g. disorder (inflammatory disorders), liver disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of trecalls, to induce tumour proliferation in pathologies eg eg acquired immune deficiency syndrome (AIDS). AAS26976-AAS2780 represent novel signal transduction cynthemial sequences and PCR primers of the invention.
                                                                                                                                                                                                                    polypeptides useful for diagnosing, treating, preventing and/or using disorders related to the proteins, including cancers, immune
                                                                                                                                                                                                                                                                                                                     Claim 1; SEQ ID No 88; 880pp; English.

WPI; 2000-602362/57.

Claim 5; Page 1978-1979; 5507pp; English.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397 which represent the human ORFX open reading frames 1 to 3161. The ORFX

```
sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; noctropic; neuroprotective; costeopathic; antiparkinsonian; noctropic; neuroprotective; costeopathic; anticonvulsant; thrombolytic; cosquiant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, enurodegenerative disorders, osteoarthritis, praft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus carptematosus, severe combined immunodeficiency (SCID), AIDS, viral, becterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, concernant hemoglophuria, antiinflammatory disease; to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AsnLeuAsnIleLysGluSerPheThrArgLeuThrGluLeuValLeuGlnAlaHisArg 174

Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders -

Claim 1; SEQ ID No 507; 880pp; English

The invention relates to novel isolated polypeptides (I), and the invention relates to novel isolated polypeptides (I), are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune system clisorders (e.g. congenital and acquired immunodeficiencies, autoimmune fisorders (e.g. theumatoid arthritis), inflammatory conditions, organ transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and chisorders, primary haematopoletic disorders, hyperproliferative disorders, primary haematopoletic disorders, hyperproliferative disorders (e.g. daucher's disease, Parkinson's disease), chromosomal abnormalities (bown syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g. glomerulonephritis), cardiovascular disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders, in wound healing, epithelial cell proliferation, endocrine disorders; (e.g. arrhythmia), respiratory disorders, (arrhators of disorder (inflammatory disorders), liver disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of the invention in pathologies e.g. acquired immune deficiency syndrome (Alds) AAS26976-AAS27860 represent novel signal transduction conting sequences and PCR primers of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         66
                                                                                                                                                                                                                                                                                                          19
                                                                                                                                                                                                                                                                                                                                                                       33
                                                                                                                                                                                                                                                                                                                                                                                                                                   29
              discloses genomic DNA sequences (ABL16176-ABL3051Í), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                140 AlaLysGluTyrGlyMetAspPheTyrGluThrSerAlaCysThrAsnLeuAsnIleLys

polypeptides of the invention have homology to known proteins, thereby cylving an insight into their probable biological activities, thenceby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; inculding cytokine, cell proliferation or cell administration activities; stem cell growth activity; mannedulatory activity; tissue growth activity; mannedulatory activity; tissue growth activity; chemotatic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incliens and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, burnerial and dingal madelian to immune disorders. Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuropithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides cytokine; cell proliferation; cell differentiation; growth factor; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiinflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; haematopoiesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder; Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer antifungal; vulnerary; antiulcer; ss. The invention relates to 2175 novel human ovarian antigens (ABP41054-C ABP4322B) and to cDNAs encoding them (ABD54131-ABD56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical comprision additionally relates to to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen solynucleotides against human ovarian antigen of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and catating, prognosing or preventing various ovary and/or breast cancer, and disorders (e.g., infertility, disorders of pregnancy, anovulation, calsorders, infertility, disorders of pregnancy, anovulation, calsorders, infertility, disorders of pregnancy, anovulation, calsorders, infertility, disorders, and dysmenorrhoea), endocrine calsorders, infertility, disorders, e.g., congenital and acquired the cast of disorders, infertiling sequence of the conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired conditions (e.g., anaemia), articlorated disorders, neutrological disorders, gastrointestinal disorders, and urinary system disorders. Ovarian antigen polypeptides and conditions cativity. The polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which collaborates and an antigen of the prepare antibodies caseful in disease diagnosis, drug targeting and phenotyping. The present collaboration of individuals and individuals and individuals and phenotyping of the presents of the pres
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                  8
                                                                                                                    ò
                                                                                           Sesociated proteins represented in AABS186. - AABS18548 Lung cancer associated proteins represented in AABS186. - AABS18548 Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; and municular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; gynecological; or antibacterial general; nephrotropic; antiinfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer, chromosome identification, as chromosome markers, and for numerous other disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may be used in the treatment of wounds and infectious diseases. Polynucleotide sequences AAF18433 and peptide AABS8549 are used in the course of the invention for the peptide AABS8549 are used in the course of the invention for the lentification and characterisation of the polynucleotide and protein
useful for treatment, prevention, and diagnosis of disorders

This invention describes a novel human RablO cDNA sequence. The protein coded by said sequence belongs to Yap/Rab family and is the homolog of mouse RablO. The present invention also relates to the polypeptide coded by said nucleotide sequence and the application and preparing process of said polynucleotide and said polypeptide. This sequence encodes the human RablO protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  39

The protein coded by said sequence belongs to Yap/Rab family and is the homolog of mouse Rablo. The present invention also relates to the polypeptide coded by said nucleotide sequence and the application and preparing process of said polymucleotide and said polypeptide. This sequence encodes the human Rablo protein described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
coded by said sequence belongs to Yap/Rab family and is the homolog of mouse Rabio. The present invention also relates to the polypeptide coded by said nucleotide sequence and the application and preparing process of said polynucleotide and said polypeptide. This sequence encodes a canine Rablo protein described in the method of the invention.
                                                                                                                                                      312
                                                                                                                                                                                                                                                            372

constitute the largest family of small Grpeases, with over 40 identified isoforms. RAB proteins contain four highly conserved peptide sequences involved in GTP binding and hydrolysis. Compositions comprising RAB nucleic acid are useful for identifying homologous or related genes, in producing compositions that modulate the expression or function of RAB, for gene therapy, mapping functional regions of the protein and in studying associated physiological pathways. In addition, modulation of the gene activity in vivo is used for prophylactic and therapeutic purposes, such as treatment of cancer, and identification of cell type based on expression. The DNA may also be used to identify expression of

The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs

160 GluSerPheThrArgLeuThrGluLeuValLeuGln 171

Claim 8; SEQ ID 17618; 2537pp + CD ROM; English.

full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 1'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs asaily without any specialised methods. AlaLysGluTyrGlyMetAspPheTyrGluThrSerAlaCysThrAsnLeuAsnIleLys 159

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in esponsible for genetic disorders or other traits to assess biodiversity Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO and to produce other types of data and products dependent on DNA and amino acid sequences. The present sequence encodes a human G-protein. The specification describes 32705, 23224, 27423, 32700 or 32712 small G-proteins. The Gescribes 32705, 23224, 27423, 32700 or 32712 small G-proteins. The G-protein polypeptides and polynucleotides are useful as a target for diagnosis and treatment of G-protein mediated or related disorders, and for identifying agonists and antagonists for diagnosis and treatment. They are useful for treating disorders of lung (e.g. congenital anomalies, pulmonary congestion, oedema, adult respiratory distress syndrome, haemorrhage, chronic obstructive pulmonary disease, asthma, Goodpasture's syndrome and pulmonary hypertension), liver (e.g. hepatic injury, jaundice, cholestasis, viral hepatitis, cirrhosis, brain (e.g. hypoxia, cerebral ischemia, intraoranial haemorrhage, acute meningitis, Parkinson's disease, Alzheimer's disease, gllomas, chronic bacterial meningoencephalitis, multiple sclerosis, amyotropic lateral selections and selective and funtington's disease).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      101 LysTrpValSerAspValAspGluTyrAlaProGluGlyValGlnLysIleLeuIleGly 120
